

**A portable contactless object featuring one or several
contactless peripheral devices**

ABSTRACT

5 The present invention concerns a portable contactless object
(10) featuring a main chip (12) and a main antenna (14) enabling
communication between the chip and the reader associated with the
portable contactless object. This portable contactless object also
features at least one contactless peripheral device (16), having a
function different than that of the main chip not connected by
ohmic contact to the latter and requiring only a small amount of
energy to operate.
